

EOC NEW USER GUIDE

Setup, navigation, diagnostics, reports, automation controls, and everyday operation

Version 1.6 GA | X4: Foundations 8.x and 9.x

THE SHORT VERSION

Install EOC, load your save, press **Control + H**, choose **Open EOC Management Window**, assign station roles, run **Analyze Now**, and review Overview, Cases, Diagnostics, and Reports. EOC acts only within the authority you grant.

Contents and the EOC workflow

Use this guide in order the first time, then keep the final quick-reference page nearby.

Section	What you will learn
1-3	Install EOC, confirm startup, open the Management Window
4-6	Navigate tabs, assign station roles, analyze the empire
7-9	Work with Cases, Reports, Fleet and Logistics
10-12	Use Diagnostics, remediation, trade and shipping controls
13-15	Global Settings, routine operation, troubleshooting and quick reference

How EOC thinks

Observe	Diagnose	Recommend	Teach	Act	Verify
Build evidence over repeated scans	Identify the likely cause	Present a bounded corrective path	Explain what the player should do	Execute only when authorized	Watch the result and update the case

PLAYER CONTROL

Managed trade orders, shipping assignment, and other supported actions remain separate controls. You can use EOC entirely as an advisor, enable one capability at a time, or keep the original pinwheel as your preferred interface.

1. Install and confirm startup

Steam Workshop installation

- Subscribe to EOC - Executive Operations Center on Steam Workshop.
- Allow Steam to finish downloading the item, then start X4.
- Confirm EOC is enabled under Extensions and load a save.

Manual installation

- Place the **JK_Station_Manager** folder inside the X4 **extensions** directory.
- Do not add an extra nested folder. **content.xml** must be directly inside the extension folder.
- Restart X4 after installing or replacing files.

Confirm it loaded

Open **Player Information > Logbook > Ticker**. Look for an EOC 1.6 GA startup entry. A startup line confirms initialization; it does not mean every station is already classified or healthy.

COMPATIBILITY

EOC 1.6 GA supports X4: Foundations 8.x and 9.x. It checks optional game constants before using them so the same release can initialize safely on both supported branches.

2. Open EOC and understand the two interfaces

Press **Control + H** to open the EOC entry menu.

Open EOC Management Window

This is the primary full-screen Lua interface. It exposes the player-facing normal and advanced workflows through persistent tabs and clear action controls.

Original EOC pinwheel

The pinwheel remains available as an optional alternative. Players who prefer the established radial workflow can continue using it. The Lua window and pinwheel use the same Mission Director-owned operational logic.

Use the Management Window when	Use the pinwheel when
You want persistent tabs, filters, selected rows, reports, guided diagnostics, and return paths.	You prefer a compact radial workflow or want quick access to a familiar command.
You need to compare Cases, Reports, Fleet information, or diagnostic findings.	You are comfortable navigating the original choices and do not need the larger workspace.

SAFE TO SWITCH

Using one interface does not disable the other. Interface preference does not expand EOC authority or bypass player-controlled safety modes.

3. Navigate the Management Window

The top tabs follow the operational flow:

Tab	Purpose
Stations	Select stations, assign roles, and use station-focused controls.
Overview	Review empire health, KPIs, trends, attention items, and executive analysis.
Fleet and Logistics	Review stations, ships, logistics scope, shipping controls, and supported actions.
Diagnostics	Use guided recovery, supplier diagnostics, stabilization findings, engineering probes, and proof status.
Cases	Filter and inspect tracked operational issues.
Reports	Read the bounded history of completed EOC reports.
Global Settings	Choose EOC-wide modes and player authorization boundaries.

TAB ORDER

Cases and Reports are the final operational tabs immediately before Global Settings. This keeps setup and operational work first, evidence and records next, and empire-wide authority controls last.

4. Assign station roles first

Station roles tell EOC what each station is intended to accomplish. This context improves role-aware diagnoses and recommendations.

Role	Use it for
Shipyard / Wharf	Stations producing ships
Defense	Defensive or strategic military stations
Factory	General production complexes
Mining Hub	Resource collection and mineral or gas distribution
Trading Hub	Ware distribution and commercial logistics
Food	Food and workforce-supply production
Technology	Advanced component and technology production
Headquarters	Player HQ or executive hub
Hybrid	Stations with several equally important purposes

FINISHED STATE

When every station is classified, Undefined Roles reports 0. You can still change any role later from the selected station workspace.

5. Overview and Analyze Now

Overview is the empire-level triage screen. Use it to understand overall health before opening individual cases.

- **Executive KPIs** summarize economy, logistics, workforce, defense, growth, and attention state.
- **Trends and change summaries** show whether the observed condition is improving, stable, or worsening.
- **Stations requiring attention** provide a focused path into station-level evidence.
- **Analyze Now** requests a fresh executive analysis checkpoint.

Run Analyze Now after

- Assigning or changing station roles.
- Completing major station modules or storage.
- Adding or reassigning ships.
- Changing logistics, trade modes, or production priorities.
- Taking corrective action on a reported shortage or pressure condition.

WAIT FOR COMPLETION

EOC reports analysis activity in the Ticker. Wait for the completion entry before judging refreshed counts, findings, or recommendations.

6. Cases, filters, and evidence

A case is retained evidence that needs review. It is not always proof of one root cause.

Level	Meaning	What to do
Critical	Immediate concern or severe repeated evidence	Open the case and station evidence first.
Warning	Developing, recurring, or lower-severity concern	Review the trend and monitor the next observations.
Action	A concrete recommended next step exists	Read the diagnosis and decide whether to act.

Using filters

- Narrow cases by the controls available on the page.
- Select a row to keep the current case in focus.
- Choose **Clear Filters** to restore the unfiltered case list in one action.

Read in this order

- **Diagnosis** - what EOC believes is happening.
- **Evidence** - samples, quantities, state, and confidence.
- **Recommendation** - the bounded corrective path.
- **Verification** - whether EOC is waiting, monitoring, improving, or resolved.

7. Reports and return-to-origin navigation

Completed reports appear in the Management Window **Reports** tab. EOC retains a bounded newest-first history and also preserves permanent report copies in **Player Information > Logbook > Tips**.

Automatic report delivery

When a report is generated from Stations, Overview, Cases, or another EOC page, the Management Window automatically opens Reports and selects the new result.

Return to Last Menu

If EOC redirected you to Reports, choose **Return to Last Menu**. EOC restores the originating page and its relevant station selection, row selection, filters, page number, scope, or view state.

How Reports was opened	Return behavior
Automatically after generating a report	Return to Last Menu is available and restores the origin.
Directly by choosing the Reports tab	No return origin is created; continue using the top tabs.

READABLE HISTORY

Select any retained report row to display its full Mission Director-generated title, content, and generation time. The interface does not replace the permanent Tips copy.

8. Fleet and Logistics

Fleet and Logistics brings station support and shipping information into one player-facing workspace.

- Use the view and scope controls to focus the station or logistics information you need.
- Use filters to narrow the displayed fleet or station support list.
- Choose **Clear Filters** to restore the full list.
- Run supported reviews or scans from visible Lua controls instead of requiring the pinwheel.
- Review the selected station and ship context before authorizing any change.

Shipping modes

Mode	Behavior
Disabled / Instructions Only	EOC diagnoses and recommends but assigns nothing.
Approval Required	EOC presents the exact ship, station, and commander role for player approval.
Auto-Assign Registered Ships	EOC may use only registered supported candidates for verified needs.

PROTECTED CANDIDATES

EOC excludes unsupported, already assigned, mission-controlled, current-player, combat-purpose, drone, unit, and XS candidates from supported automatic assignment workflows.

9. Diagnostics and guided recovery

Diagnostics provides guided tools for understanding why a station or supply path is not stabilizing.

Diagnostic area	What it provides
Guided Recovery	A structured path from current condition to evidence, suggested action, and verification.
Supplier Diagnostics	Supplier and supply-path findings relevant to the selected station or ware.
Stabilization	Current goals, bounded findings, and mailbox or saved-status information.
Engineering Probes	Targeted evidence checks used to confirm specific operational assumptions.
Medical Supplies Proof	A focused proof-status path for the Medical Supplies recovery workflow.

Recommended use

1. Select the relevant station or diagnostic scope.
2. Read current findings before running another probe.
3. Use the guided action only when the evidence and player instructions are clear.
4. Return later to confirm the stabilization or proof status changed.

DIAGNOSTICS DO NOT EXPAND AUTHORITY

Diagnostic visibility and engineering probes expose evidence. They do not grant EOC permission to execute unrelated changes.

10. Operational remediation and managed trade orders

Operational remediation turns repeated observations into a tracked problem-solving cycle.

Status	Meaning
Open	Evidence supports a current problem.
Verifying	A corrective change occurred and EOC is watching the result.
Resolved	Later observations show the condition cleared.
Escalated	Evidence worsened or the earlier recommendation did not resolve the issue.

Managed trade orders

Managed trade orders are a separate opt-in capability. In Instructions Only mode, EOC explains the supported buy or sell correction without changing offers. When enabled, EOC may create or adjust a supported offer only where evidence indicates a blocker, then verify the state.

- Buy targets use target stock minus current stock.
- Sell targets use current stock minus target stock.
- X4 station management still determines individual shipment sizes.
- Disable the mode later to stop future EOC trade-order management.

DO NOT CHASE ONE SAMPLE

EOC is designed to act on repeated, sufficiently complete evidence. A temporary shortage may clear without intervention.

11. Approve and verify ship assignments

In Approval Required mode, review all three proposal fields before authorizing:

Field	Confirm
Ship	The exact supported candidate EOC intends to use.
Role	The X4 commander assignment, such as Trade for Commander.
Station	The exact receiving station.

- 1. Choose Authorize This Assignment only when the ship, role, and station pairing is acceptable.
- 2. Choose Back - No Change to leave the ship untouched. Backing out is never interpreted as approval.
- 3. Watch for the Ticker action-complete entry naming the ship, station, and role.
- 4. Open the Property view. The ship should no longer appear under Unassigned Ships and should appear under the intended station structure.

PASS CONDITION

The Ticker reports completion, the exact ship is no longer unassigned, and the intended X4 commander relationship is visible under the receiving station.

12. Global Settings, messages, and the pinwheel

Global Settings is the final tab because it controls empire-wide EOC behavior and authorization modes rather than one operational record.

- Review each mode before enabling it.
- Enable one managed capability at a time until its behavior is familiar.
- Recheck settings after changing a mod version or loading an older save.
- Use the Ticker for startup, analysis completion, action completion, warnings, and verification evidence.

Player-facing messages

EOC 1.6 uses complete readable labels and action feedback. If a message is unclear, record the page, action, selected station, and exact wording before reporting it.

Pinwheel remains optional

The pinwheel is not a hidden requirement. Normal and advanced player workflows are available through the Lua Management Window, while the pinwheel remains available for players who prefer it.

AUTHORITY IS SHARED, NOT DUPLICATED

Both interfaces call the same Mission Director-owned business logic and preserve the same player authorization boundaries.

13. A simple everyday operating routine

When	Action
After load	Confirm the EOC 1.6 startup entry in Ticker.
When stations change	Keep Undefined Roles at 0 and classify new stations.
After major empire changes	Run Analyze Now and wait for completion.
During triage	Review Critical cases, then Warnings, then other action items.
When a cause is unclear	Open Diagnostics and follow the bounded recovery path.
Before acting	Read diagnosis, evidence, recommendation, and verification state.
After acting	Allow observation cycles to verify improvement or resolution.
Periodically	Confirm trade, shipping, and Global Settings still match your preference.

ONE MANAGED CAPABILITY AT A TIME

Leave automation in Instructions Only mode until the reports and recommendations make sense. Enable one supported capability, verify its behavior, then decide whether to enable another.

14. Troubleshooting

Symptom	Check
UI does not open	Confirm EOC is enabled, verify the startup Ticker entry, and inspect the EOC portion of the debug log for a Lua load error.
No report appears	Check the Reports tab first, then Player Information > Logbook > Tips for the permanent copy.
Return to Last Menu is absent	It appears only when EOC automatically redirected you to Reports; direct Reports navigation has no origin.
Counts did not change	Wait for Analysis Complete or run Analyze Now after the game state settles.
No ship is registered	Confirm it is player-owned, supported, operational, genuinely unassigned, and suited to an evidenced need.
A mod-added ship is ignored	EOC avoids hard-coded dependencies on other mods; unsupported candidates remain untouched.
A diagnostic status is unchanged	Confirm the selected station or scope, run the intended probe once, then allow the next EOC cycle to update evidence.

When reporting a problem

- Include X4 version and hotfix number.
- Include EOC version and the exact menu action that preceded the issue.
- Include a screenshot only when it helps show the visual state.
- Include the relevant EOC debug-log lines and separate unrelated third-party mod errors.

SAVE SAFETY

Keep normal rotating saves before major mod or game-version changes. Removing EOC does not make an existing save dependent on the mod.

15. Quick-reference menu map

Area	Primary use
Stations	Station selection, roles, station controls, and station reports.
Overview	Empire health, KPIs, trends, attention items, and Analyze Now.
Fleet and Logistics	Station support, ships, logistics scope, shipping scans, and assignment modes.
Diagnostics	Guided Recovery, Supplier Diagnostics, Stabilization, Engineering Probes, and proof status.
Cases	Filtered issue review, evidence, selection, and Clear Filters.
Reports	Newest-first report history, full report display, and Return to Last Menu after automatic redirects.
Global Settings	Empire-wide modes and player authorization boundaries.
Pinwheel	Optional alternative access to the established EOC workflows.

Best first session

1. Confirm startup.
2. Assign all station roles.
3. Run Analyze Now and wait for completion.
4. Review Overview and Critical cases.
5. Generate and read an Empire Executive report.
6. Use Diagnostics when evidence needs guided recovery.
7. Leave managed actions disabled until the recommendations make sense.

EOC OPERATING PRINCIPLE

Observe. Diagnose. Recommend. Teach. Safely execute when authorized. Verify. You stay in control; EOC works for you.
